

Summary

Method for providing a device code for an electronic device.

The invention relates to a method for the provision of a device code for an electronic device, which is at least required for the first commissioning of the device code, whereby the device is inoperable without the input of the device code. The method is characterized in that the following procedural steps are carried out: Storage of a device number and an appropriate device code in a database, delivery of the device to a further processing site and readout of the device code stored in the database in conjunction with the device number, whereby the previous or simultaneous storage of a selected code number in the database in conjunction with the device number is required for readout.
